

Pin Configuration

Ordering Information

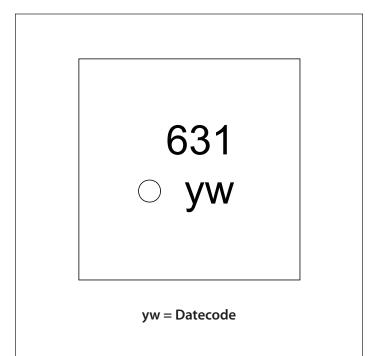

Device	Package
SC631ULTRT ⁽¹⁾⁽²⁾	MLPD-UT-8 2x2
SC631EVB	Evaluation Board

Notes:

(1) Available in tape and reel only. A reel contains 3,000 devices.

(2) Lead-free package only. Device is WEEE and RoHS compliant.

Marking Information

Absolute Maximum Ratings

IN (V)0.3 to +6.0)
OUT (V)0.3 to +6.0)
C1+, C2+ (V)0.3 to (V _{out} + 0.3))
Pin Voltage — All Other Pins (V) $\dots -0.3$ to (V _{IN} + 0.3))
OUT pin — Short Circuit Duration Continuous	5
ESD Protection Level ⁽²⁾ (kV)	2

Recommended Operating Conditions

Ambient Temperature Range (°C)	$-40 \le T_A \le +85$
IN (V)	$2.9 \leq V_{IN} \leq 5.5$

Thermal Information

Thermal Resistance, Junction to $Ambient^{(1)}(^{\circ}C/W) \dots 68$
Maximum Junction Temperature (°C)+150
Storage Temperature Range (°C)
Peak IR Reflow Temperature (10s to 30s) (°C)+260

Exceeding the above specifications may result in permanent damage to the device or device malfunction. Operation outside of the parameters specified in the Electrical Characteristics section is not recommended.

NOTES

(1) Calculated from package in still air, mounted to 3 x 4.5 (in), 4 layer FR4 PCB with thermal vias under the exposed pad per JESD51 standards.

Unless otherwise specified: $T_{A} = +25^{\circ}C$ for Typ, -40°C to +85°C for Min and Max; $C_{1} = C_{2} = 2.2\mu$ F (ESR < 0.03 Ω); $C_{IN} = C_{CIIT} = 22\mu$ F; $V_{IN} = 2.9V$ to 5.5V

(2) Tested according to JEDEC standard JESD22-A114-B.

Electrical Characteristics -

Parameter	Symbol	Condition		Тур	Мах	Units

Pin Descriptions

Pin	Pin Name	Pin Function	
1	GND	Ground — connect to ground plane with multiple vias	
2	C1+	Positive terminal of bucket capacitor 1	
3	C1-	Negative terminal of bucket capacitor 1	
4	IN	Input supply voltage	
5	EN	Chip enable — active-high	
6	OUT	Output	
7	C2+	Positive terminal of bucket capacitor 2	
8	C2-	Negative terminal of bucket capacitor 2	
т	Thermal Pad	This pad is for heat sinking and is not connected internally. It must be connected to a ground plane using multiple vias.	

Block Diagram

Applications Information

General Description

The SC631 is a 4.4V output charge pump regulator designed to support up to 325mA ($T_A \le 55^{\circ}C$, 2.92V $\le V_{IN} \le 5.5V$) and 250mA ($T_A \le 85^{\circ}C$, 2.90V $\le V_{IN} \le 5.5V$) of continuous current. SC631 applications include power for LEDs and audio amplifiers in portable handheld equipment. SC631 may be used in conjunction with regulated current sink devices such as the SC620 Octal LED Driver or with ballast resistors.

The SC631 has three operating modes — 1x, 1.5x, and 2x. The 1x mode is a linear series regulation mode with a low open-loop output resistance of only $250m\Omega$. The 1x mode functions as a low-noise linear regulator. The 1.5x and 2x modes are a low noise, constant frequency, constant duty cycle switch mode, using two bucket capacitors. One bucket supports the full output current while the other bucket charges from the input. The two buckets exchange roles in the next phase, supplying continuous output current in both phases and reducing the need for a large output decoupling capacitor. The constant frequency, constant duty cycle operation also produces predictable constant frequency harmonics.

Mode Transition Hysteresis

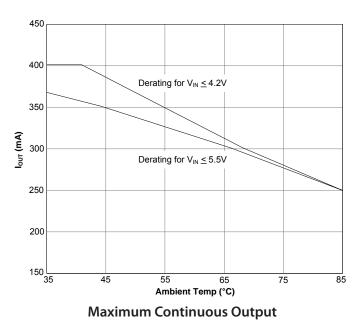

Hysteresis is provided to prevent chatter between charge pump modes for input steps of up to 120mV. For optimum transient performance, it is recommended for the supply decoupling capacitance be large enough to prevent steps greater than 120mV. Normally $C_{IN} = 22uF$ is sufficient to minimize supply transients during the charge pump mode transitions.

Thermal Resistance

The SC631 package is thermally efficient when the circuit board layout connects the thermal pad through multiple vias to the ground plane. The thermal resistance rating is dependent upon the connection between the thermal pad and the ground plane. A layout that is done correctly should keep the junction temperature below the overtemperature limit while operating the SC631 within the specified electrical conditions. A poor layout may allow the junction temperature to reach the over temperature limit, so it is important to maintain adequate ground plane around the device to maximize heat transfer to the PCB.

Temperature Derating

The V_{IN} supply range and ambient temperature range of the application should be compared with the following derating curve to determine the maximum safe continuous load current. The DC operating points beneath each curve are in the safe operating temperature range of the MLP package.

Protection Circuitry

The SC631 also provides protection circuitry that prevents the device from operating in an unspecified state. These functions include:

- Over-Current Protection (OCP)
- Short-Circuit Current Protection (SCCP)
- Over-Temperature Protection (OTP)

Applications Information (continued)

Over-Current Protection

Over-current protection is provided to limit the output current. When V_{out} is greater than 2V, OCP limits the output to 1A typical. The 2V threshold allows the device to recover from excessive voltage droop during an over-current event.

Short-Circuit Current Protection

Short-circuit current protection is provided to limit the current that can be sourced when the output is shorted to ground. When a short circuit forces V_{OUT} to drop below 2V, the SCCP detects the condition and limits the output current to 600mA (typical).

Over-Temperature Protection

The over-temperature circuit helps prevent the device from overheating and experiencing a catastrophic failure. When the junction temperature exceeds 165°C, the device is disabled. It remains disabled until the junction temperature drops below this threshold. Hysteresis is included that prevents the device from re-enabling until the junction temperature is reduced by 20°C.

Capacitor Selection

The SC631 is designed to use low-ESR ceramic capacitors for the input and output bypass capacitors as well as the charge pump bucket capacitors. Ideal performance is achieved when the bucket capacitors are exactly equal. The value of input and output decoupling capacitors will vary with system requirements. For best ripple performance C_{IN} and C_{OUT} are normally 22µF and the bucket capacitors C_1 and C_2 are 2.2µF. For low profile designs, two 10µF capacitors may be used in place of each 22µF. When selecting capacitors for the application, the DC voltage characteristic of the capacitor should be considered. The value of capacitance at the DC operating voltage may be considerably lower than the rated value. The following table lists recommended capacitor values which have been chosen to minimize the impact of this limitation.

Capacitor	Value μF	Case Size	Notes
	22 0805	0005	Typical output $V_{pp} \le 20mV$ in all charge pump modes
C _{IN} , C _{OUT}		0805	Typical input ripple \leq 100mV in all charge pump modes
C _{BUCKET}	2.2	0603	Required for the full rated output current
C _{BUCKET}	2.2	0402	Useful for load current up to 300mA

Table 1 — Recommended Capac	itors
-----------------------------	-------

NOTE: Use only X5R type capacitors, with a 6.3V rating or higher

The highest capacitance values in the smallest package sizes tend to have poor DC voltage characteristics. The highest value 0402 size capacitor retains as little as 35% of its rated value at 5VDC. The same value chosen in the next larger package size (0603) retains about 60% of its rated value at 5VDC.

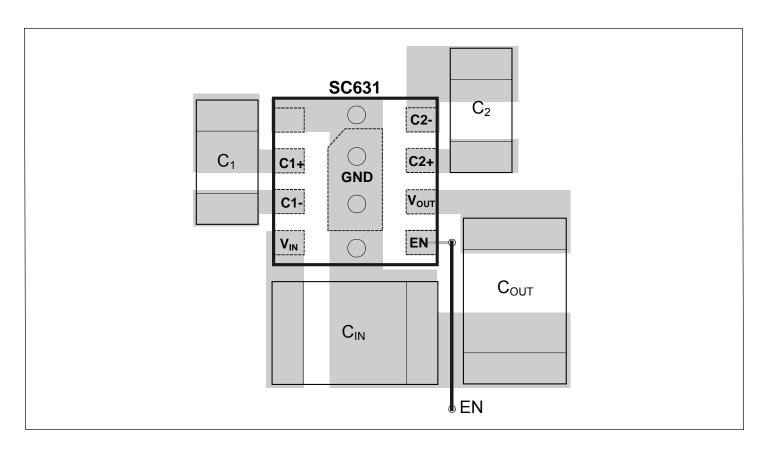

Applications Information (continued)

PCB Layout Considerations

Poor layout can degrade the performance of the regulator and can be a contributory factor in EMI problems, ground bounce, thermal issues, and resistive voltage losses. Poor regulation and instability can result.

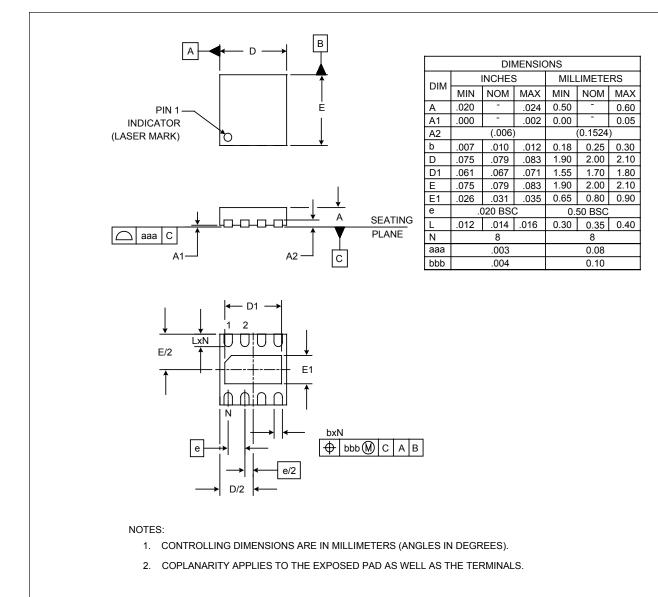

The following design rules are recommended:

- Place the bucket capacitors as close to the device as possible and on the same side of the board. Use short wide copper areas between the capacitor pins and the device pins.
- 2. Place the input and output decoupling capacitors as close as possible to the device and connect these capacitors' ground pads together to the ground plane using multiple vias through a short wide copper area.
- 3. Connect pin 1 directly to the copper area under the thermal pad.
- 4. The thermal pad at the center of the device is not electrically connected. Connect this pad to the ground plane using multiple vias.
- 5. Use a ground plane to further reduce noise interference on sensitive circuit nodes.
