Non-repetitive peak on-state current (see Notes 2 and 3) 50 Hz, 1 s	D Package	$I_{\text{TSM}}$	4	A rms
	SL Package		6	
Initial rate of rise of on-state current, Linear current ramp, Maximum ramp value $< 38 \text{ A}$		$di_T/dt$	250	A/ $\mu\text{s}$
Junction temperature		$T_J$	-40 to +150	$^{\circ}\text{C}$
Storage temperature range		$T_{\text{stg}}$	-40 to +150	$^{\circ}\text{C}$

- NOTES: 1. Further details on surge wave shapes are contained in the Applications Information section.  
 2. Initially the TISP must be in thermal equilibrium with  $0^{\circ}\text{C} < T_J < 70^{\circ}\text{C}$ . The surge may be repeated after the TISP returns to its initial conditions.  
 3. Above  $70^{\circ}\text{C}$ , derate linearly to zero at  $150^{\circ}\text{C}$  lead temperature.

## APPLICATIONS INFORMATION

### electrical characteristics

The electrical characteristics of a TISP are strongly dependent on junction temperature,  $T_J$ . Hence a characteristic value will depend on the junction temperature at the instant of measurement. The values given in this data sheet were measured on commercial testers, which generally minimise the temperature rise caused by testing. Application values may be calculated from the parameters' temperature curves, the power dissipated and the thermal response curve ( $Z_{\theta}$ ).

### lightning surge

#### wave shape notation

Most lightning tests, used for equipment verification, specify a unidirectional sawtooth waveform which has an exponential rise and an exponential decay. Wave shapes are classified in terms of peak amplitude (voltage or current), rise time and a decay time to 50% of the maximum amplitude. The notation used for the wave shape is *amplitude, rise time/decay time*. A 50A, 5/310  $\mu$ s wave shape would have a peak current value of 50 A, a rise time of 5  $\mu$ s and a decay time of 310  $\mu$ s. The TISP surge current graph comprehends the wave shapes of commonly used surges.

### generators

There are three categories of surge generator type, single wave shape, combination wave shape and circuit defined. Single wave shape generators have essentially the same wave shape for the open circuit voltage and short circuit current (e.g. 10/1000  $\mu$ s open circuit voltage and short circuit current). Combination generators have two wave shapes, one for the open circuit voltage and the other for the short circuit current (e.g. 1.2/50  $\mu$ s open circuit voltage and 8/20  $\mu$ s short circuit current) Circuit specified generators usually equate to a combination generator, although typically only the open circuit voltage waveshape is referenced (e.g. a 10/700  $\mu$ s open circuit voltage generator typically produces a 5/310  $\mu$ s short circuit current). If the combination or circuit defined generators operate into a finite resistance the wave shape produced is intermediate between the open circuit and short circuit values.

### current rating

When the TISP switches into the on-state it has a very low impedance. As a result, although the surge wave shape may be defined in terms of open circuit voltage, it is the current wave shape that must be used to assess the required TISP surge capability. As an example, the CCITT IX K17 1.5 kV, 10/700  $\mu$ s surge is changed to a 38 A, 5/310  $\mu$ s waveshape when driving into a short circuit. Thus the TISP surge current capability, when directly connected to the generator, will be found for the CCITT IX K17 waveform at 310  $\mu$ s on the surge graph and not 700  $\mu$ s. Some common short circuit equivalents are tabulated below:

STANDARD	OPEN CIRCUIT VOLTAGE	SHORT CIRCUIT CURRENT
CCITT IX K17	1.5 kV, 10/700 $\mu$ s	38 A, 5/310 $\mu$ s
CCITT IX K20	1 kV, 10/700 $\mu$ s	25 A, 5/310 $\mu$ s
RLM88	1.5 kV, 0.5/700 $\mu$ s	38 A, 0.2/310 $\mu$ s
VDE 0433	2.0 kV, 10/700 $\mu$ s	50 A, 5/200 $\mu$ s
FTZ R12	2.0 kV, 10/700 $\mu$ s	50 A, 5/310 $\mu$ s

Any series resistance in the protected equipment will reduce the peak circuit current to less than the generators' short circuit value. A 2 kV open circuit voltage, 50 A short circuit current generator has an effective output impedance of 40  $\Omega$  (2000/50). If the equipment has a series resistance of 25  $\Omega$  then the surge current requirement of the TISP becomes 31 A (2000/65) and not 50 A.

## PRODUCT INFORMATION

**APPLICATIONS INFORMATION**

**protection voltage**

The protection voltage, ( $V_{(BO)}$ ), increases under lightning surge conditions due to thyristor regeneration. This increase is dependent on the rate of current rise,  $di/dt$ , when the TISP is clamping the voltage in its breakdown region. The  $V_{(BO)}$  value under surge conditions can be estimated by multiplying the 50 Hz rate  $V_{(BO)}$  (250 V/ms) value by the normalised increase at the surge's  $di/dt$  (Figure 7.) . An estimate of the  $di/dt$  can be made from the surge generator voltage rate of rise,  $dv/dt$ , and the circuit resistance.

As an example, the CCITT IX K17 1.5 kV, 10/700  $\mu$ s surge has an average  $dv/dt$  of 150 V/ $\mu$ s, but, as the rise is exponential, the initial  $dv/dt$  is higher, being in the region of 450 V/ $\mu$ s. The instantaneous generator output resistance is 25  $\Omega$ . If the equipment has an additional series resistance of 20  $\Omega$ , the total series resistance becomes 45  $\Omega$ . The maximum  $di/dt$  then can be estimated as 450/45 = 10 A/ $\mu$ s. In practice the measured  $di/dt$  and protection voltage increase will be lower due to inductive effects and the finite slope resistance of the TISP breakdown region.

**capacitance**

**off-state capacitance**

The off-state capacitance of a TISP is sensitive to junction temperature,  $T_J$ , and the bias voltage, comprising of the dc voltage,  $V_D$ , and the ac voltage,  $V_d$ . All the capacitance values in this data sheet are measured with an ac voltage of 100 mV. The typical 25°C variation of capacitance value with ac bias is shown in Figure 13 When  $V_D \gg V_d$  the capacitance value is independent on the value of  $V_d$ . The capacitance is essentially constant over the range of normal telecommunication frequencies.

**plastic small-outline package**

This small-outline package consists of a circuit mounted on a lead frame and encapsulated within a plastic compound. The compound will withstand soldering temperature with no deformation, and circuit performance characteristics will remain stable when operated in high humidity conditions. Leads require no additional cleaning or processing when used in soldered assembly.

- NOTES: A. Leads are within 0,25 (0.010) radius of true position at maximum material condition.  
 B. Body dimensions do not include mold flash or protrusion.  
 C. Mold flash or protrusion shall not exceed 0,15 (0.006).  
 D. Lead tips to be planar within ±0,051 (0.002).

**tape dimensions**

NOTES: A. Taped devices are supplied on a reel of the following dimensions:-

MDXXAT

Reel diameter: 330 +0,0/-4,0 mm  
 Reel hub diameter: 100 ±2,0 mm  
 Reel axial hole: 13,0 ±0,2 mm

B. 2500 devices are on a reel.

### IMPORTANT NOTICE

Power Innovations Limited (PI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to verify, before placing orders, that the information being relied on is current.

PI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with PI's standard warranty. Testing and other quality control techniques are utilized to the extent PI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except as mandated by government requirements.

PI accepts no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor is any license, either express or implied, granted under any patent right, copyright, design right, or other intellectual property right of PI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.

PI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS.
