### **OPERATION - POWER MONITOR**

The DS1810 provides the function of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When  $V_{CC}$  is detected as out-of-tolerance, the  $\overline{RST}$  signal is asserted. On power-up,  $\overline{RST}$  is kept active for approximately 150 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before  $\overline{RST}$  is released.

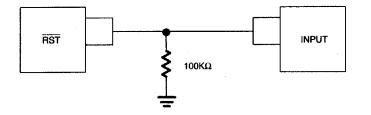

## BLOCK DIAGRAM (PUSH-PULL OUTPUT) Figure 1

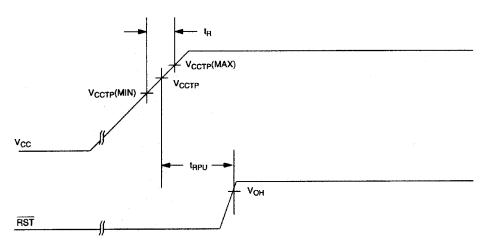

### **OUTPUT VALID CONDITIONS**

All versions of the DS1810 can maintain a valid output as long as  $V_{CC}$  remains above 1.2 volt. However, the  $\overline{RST}$  outputs on the DS1810 use a push-pull structure which can maintain a valid output below 1.2 volts on an input. To sink current below 1.2 volts, a resistor can be connected from  $\overline{RST}$  to Ground (see Figure 3). This arrangement will maintain a valid value on the  $\overline{RST}$  outputs even it  $V_{CC}$  approaches 0 volts. During both power-up and -down this arrangement will draw current when  $\overline{RST}$  is in the high state. A value of about 100 k $\varsigma$  should be adequate to maintain a valid condition.

### NOTES:

- 1. All voltages are referenced to ground.
- 2. Measured with  $V_{CC} \ge 2.7$  volts.
- 3. Measured with  $\overline{RST}$  output open.
- 4.  $t_R = 5 \ \mu s$ .

### PART MARKING CODES
