

select inputs A or B (see frequency selection table). The output is available in one of the two modes that can be selected via the MODE input pin 10 (see truth table). The output turns out as a continuous square wave, with a frequency equal to the oscillator frequency divided by 2^N when this MODE input is a logic "1". When it is a logic "0" and after a MASTER RESET is started, and Q output has been selected, the output goes up to a high state after 2^{N-1} counts. It remains in that state till another MASTER RESET pulse is applied or the mode input is a logic "1". The process starts by setting the AUTO RESET input (pin 5) to logic

INPUT EQUIVALENT CIRCUIT

"0" and switching power on. If pin 5 is set to logic "1", the AUTO RESET circuit is not enabled and counting cannot start till a positive MASTER RESET pulse is applied, returning to a low level. The AUTO RESET consumes a remarkable amount of power and should not be used if low power operation is wanted. The frequency of the oscillator depends on the RC network. It can be calculated using the following formula :

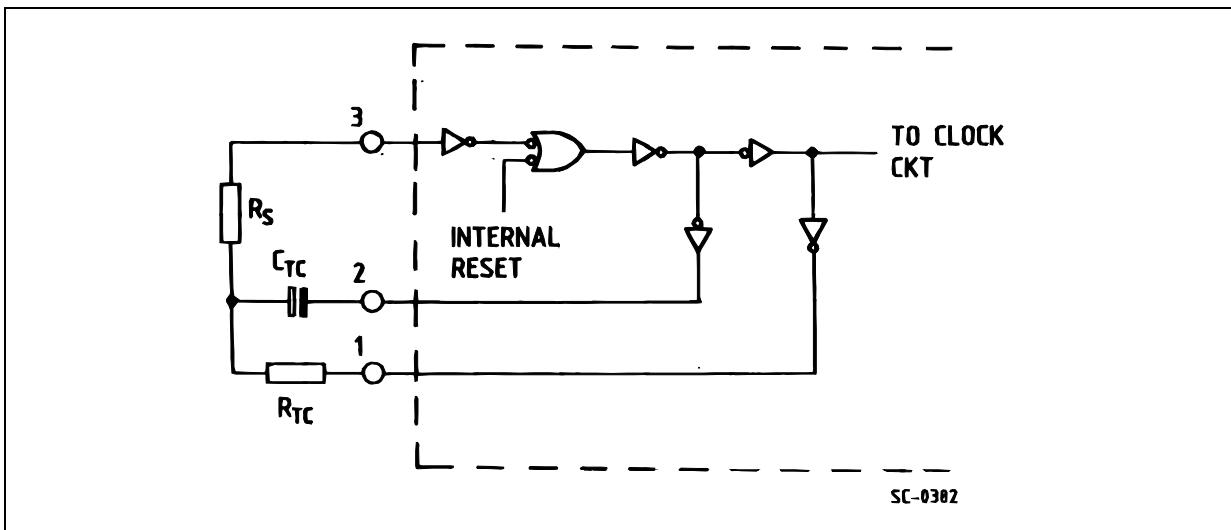

$$f = 1 / 2.3 R_{TC} C_{TC}$$

where f is between 1KHz and 100KHz and RS \geq 10 K Ω and $\approx 2 R_{TC}$

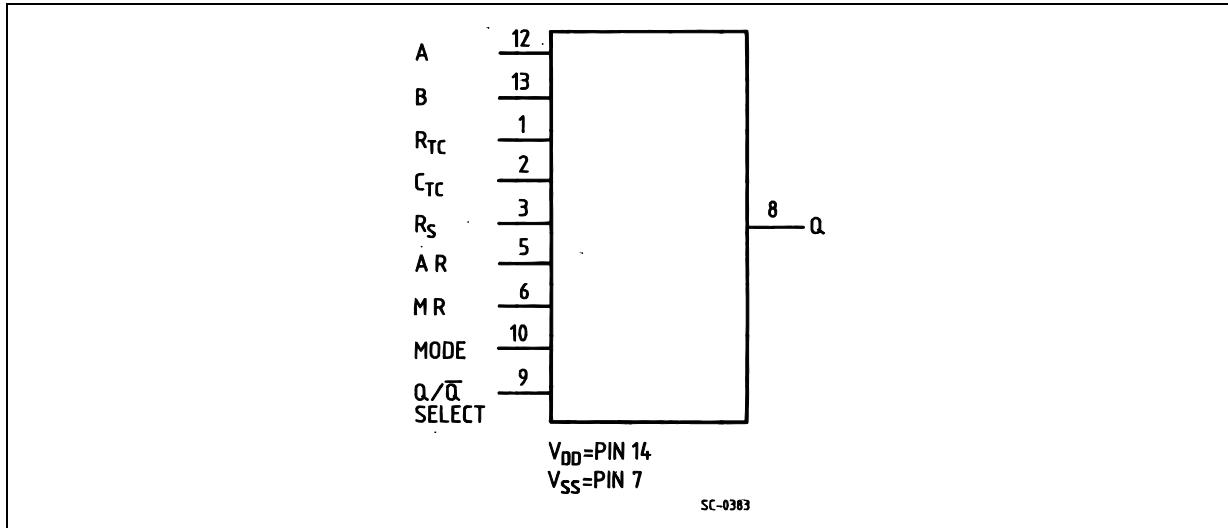

PIN DESCRIPTION

PIN No	SYMBOL	NAME AND FUNCTION
12, 13	A, B	Time Select Input
4, 11	NC	Not Connected
1, 2	R _{TC} , C _{TC}	External Resistor, Capacitor Connection
3	R _S	External Resistor Connection or External Clock Input
5	AR	Auto Reset Input
6	MR	Master Reset Input
10	MODE	Mode Select Input
9	Q/Q SELECT	Output Selector
8	Q	Output
7	V _{SS}	Negative Supply Voltage
14	V _{DD}	Positive Supply Voltage

RC OSCILLATOR CIRCUIT

TRUTH TABLE

PIN	STATE	
	L	H
5	Auto Reset On	Auto Reset Disable
6	Master Reset Off	Master Reset On
9	Output Initially Low After Reset (Q)	Output Initially High After Reset (Q)
10	Single Transition Mode	Recycle Mode

LOGIC DIAGRAM

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{DD}	Supply Voltage	-0.5 to +22	V
V_I	DC Input Voltage	-0.5 to $V_{DD} + 0.5$	V
I_I	DC Input Current	± 10	mA
P_D	Power Dissipation per Package	200	mW
	Power Dissipation per Output Transistor	100	mW
T_{op}	Operating Temperature	-55 to +125	°C
T_{stg}	Storage Temperature	-65 to +150	°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

All voltage values are referred to V_{SS} pin voltage.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V_{DD}	Supply Voltage	3 to 20	V
V_I	Input Voltage	0 to V_{DD}	V
T_{op}	Operating Temperature	-55 to 125	°C

DC SPECIFICATIONS

		10			50	100	
		15			40	80	
t_{TLH}	Transition Time	5			180	360	ns
		10			90	180	
		15			65	130	
	Master Reset, Clock Pulse Width	5		900	300		ns
		10		300	100		
		15		225	85		
f_{CL}	Maximum Clock Pulse Input Frequency	5			1.5		MHz
		10			4		
		15			6		
t_r, t_f	Maximum Clock Pulse Input Rise or Fall Time	5		Unlimited			μs
		10					
		15					

(*) Typical temperature coefficient for all V_{DD} value is 0.3 %/ $^{\circ}\text{C}$.

DIGITAL TIMER APPLICATION

A positive MASTER RESET pulse clears the counter and latch. The Output goes high and keeps up till the number of pulses, selected by A and B , are counted. This circuit is retriggerable and is as accurate as the input frequency. If a

more accurate circuit is desired, an external clock can be used on pin 3. A set-up time equal to the width of the one shot output is required immediately following initial power up, during which time the output will be high

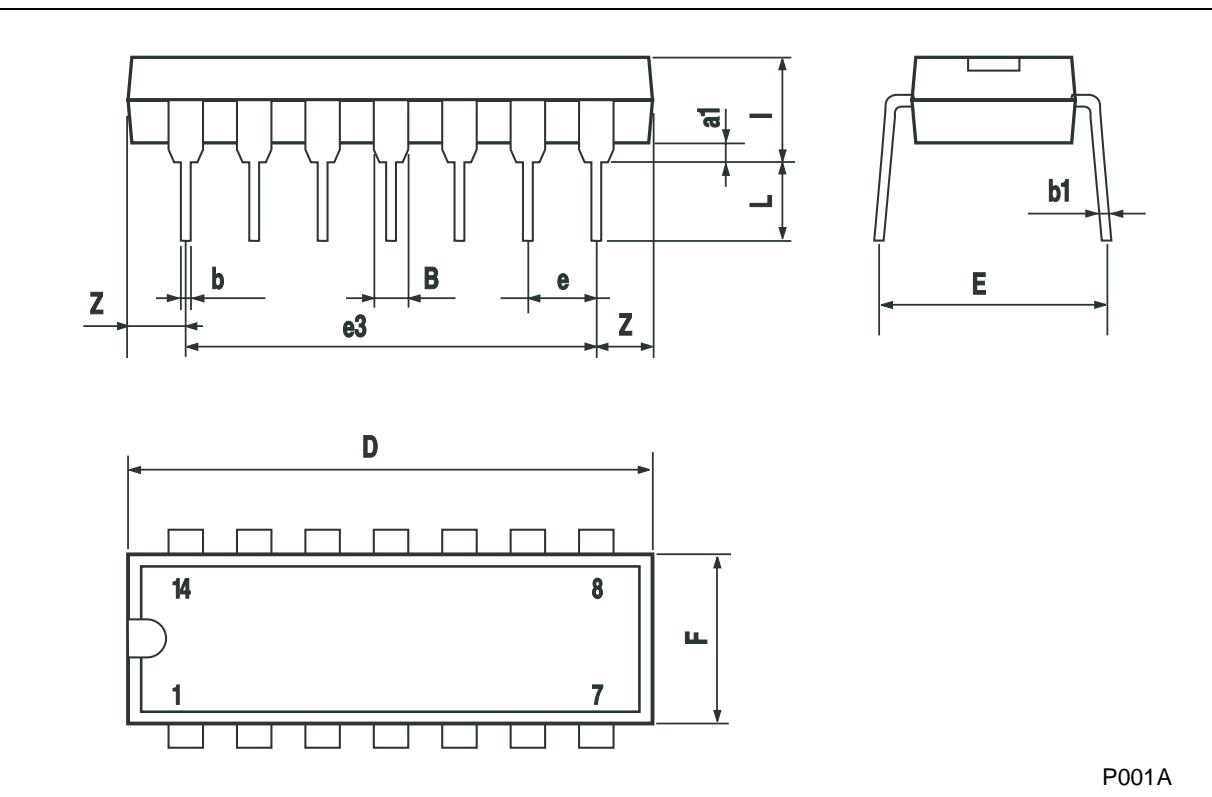

TEST CIRCUIT

$C_L = 50\text{pF}$ or equivalent (includes jig and probe capacitance)

$R_L = 200\text{K}\Omega$

$R_T = Z_{OUT}$ of pulse generator (typically 50Ω)
