MAX8606

Pin Description

PIN	NAME	FUNCTION
1, 2	BAT	Battery Connection. The IC delivers charging current and monitors battery voltage using BAT. Connect both BAT outputs together externally. During suspend mode, BAT is internally connected to SYS.
3	IN	Supply Voltage Input. Connect IN to a 4.25V to 5.5V supply. Charging is suspended if V_{IN} exceeds 6V. Bypass IN to GND with a 4.7µF or larger ceramic capacitor.
4	VL	+3.3V Output Voltage and Logic Supply. VL is regulated to +3.3V and is capable of sourcing 500µA to provide power for external circuits. Bypass VL to GND with a 0.1µF or larger ceramic capacitor. VL is internally pulled to GND during suspend mode.
5	THM	Thermistor Input. Connect a 10kΩ NTC thermistor from THM to GND in close proximity to the battery to monitor the battery temperature. The IC suspends charging when the temperature is outside the hot and cold limits. Connect THM to GND to disable the thermistor monitoring function.
6	$\overline{CHG}$	Charging Status Output. $\overline{CHG}$ is an open-drain output that goes low when the battery is charging. $\overline{CHG}$ goes high impedance when the charge current drops below 50mA (typ) and the battery voltage is 4.2V (typ). $\overline{CHG}$ is high impedance when the IC is in suspend mode.
7	$\overline{POK}$	Power-OK Monitor. $\overline{POK}$ is an open-drain output that pulls low when a valid charging source is detected at IN.
8	$\overline{TMR}$	Timer-Selection Input. Drive $\overline{TMR}$ high to enable the microprocessor mode where the charge times are determined by an external device. Drive $\overline{TMR}$ low to use the internal prequal, fast-charge, and top-off timers.
9	$\overline{EN2}$	Charge-Current Selection Input. Drive $\overline{EN\_}$ high or low to select the charge current or to put the MAX8606 into suspend mode (see Table 1).
10	$\overline{EN1}$	Charge-Current Selection Input. Drive $\overline{EN\_}$ high or low to select the charge current or to put the MAX8606 into suspend mode (see Table 1).
11	GND	Ground. Connect directly to exposed paddle under the IC.
12	SETI	Charge-Current Programming Input. Connect a resistor from SETI to GND to set the maximum charging current. R_{SETI} must be between 17.68kΩ and 35.36kΩ.
13, 14	SYS	System Supply Output. SYS delivers up to $1A_{RMS}$ to power an external system. Bypass SYS to GND with a 4.7µF or larger ceramic capacitor. SYS is connected to BAT through an internal 50mΩ switch when V_{BAT} exceeds 3.5V or when the MAX8606 is in suspend mode.
—	EP	Exposed Paddle. Connect to GND under the IC. Connect to a large ground plane to improve power dissipation.

Detailed Description

The MAX8606 charger uses current, voltage, and thermal control loops to charge and protect a single Li+ battery cell. It can start the system even when the battery is in deep saturation. The MAX8606 provides a SYS output that supplies the external system with a minimum 3.5V at 1A.

Two active-low enable inputs ($\overline{EN1}$ and $\overline{EN2}$) are supplied to set the SYS and charging current limits. During prequal and fast-charge modes, the $\overline{CHG}$ output status flag is pulled low. As the battery voltage approaches 4.2V, the charging current is reduced. When the charging current drops below 50mA and the battery voltage equals 4.2V, the $\overline{CHG}$ output goes high impedance, signaling a full battery. At any time during charging, if both $\overline{EN1}$ and $\overline{EN2}$ are driven high, the charger enters suspend mode, charging stops, and $\overline{CHG}$ goes high impedance.

The MAX8606 contains an internal timer to measure the prequal, fast-charge, and top-off charge time. If the battery voltage has not risen above 3V after 30 minutes or has not completed fast-charge in 8 hours, the charger goes into a fault state where the charging is
MAXIM

Figure 1. MAX8606 State Diagram

suspended and the $\overline{CHG}$ flag turns on and off at 2Hz. Either the input power must be cycled or the suspend mode enabled to clear the fault.

$\overline{EN1}$ and $\overline{EN2}$ Inputs

$\overline{EN1}$ and $\overline{EN2}$ are logic inputs that enable the charger and select the charging current (see Table 1). Drive $\overline{EN1}$ and $\overline{EN2}$ high to place the IC in suspend mode.

USB/AC Adapter, Li+ Linear Battery Charger with Integrated 50mΩ Battery Switch in TDFN
Figure 2. MAX8606 Block Diagram

VL Internal Voltage Regulator

The MAX8606 linear charger contains an internal linear regulator to supply the power for the IC. Bypass VL to GND with a 0.1µF ceramic capacitor. VL is regulated to 3.3V whenever the input voltage is above the battery voltage and can source up to 500µA for external loads.

CHG Charge-Indicator Output

$\overline{CHG}$ is an open-drain output that indicates charger status and can be used with an LED. $\overline{CHG}$ goes low during charging. $\overline{CHG}$ goes high impedance when V_{BAT} equals 4.2V and the charging current drops below 50mA. When the MAX8606 is used in conjunction with a microprocessor (µP), connect a pullup resistor between $\overline{CHG}$ and the logic I/O voltage to indicate charge status to the µP. $\overline{CHG}$ also indicates a timer fault. If the internal prequal or fast-charge timer expires without completing the charge cycle, charging is suspended and the $\overline{CHG}$ output "blinks" at 2.1Hz.

Soft-Start

To prevent input transients, the rate of change of the charge current is limited when the charger is turned on or changes its current compliance. It takes approximately 1ms for the charger to go from 0mA to the maximum fast-charge current.

TMR Input

The MAX8606 includes a 30-minute prequalification fault timer, an 8-hour fast-charge fault timer, and a 30-minute top-off timer to terminate the changing cycle. Drive $\overline{TMR}$ low to enable the internal timers. Drive $\overline{TMR}$ high to disable the internal timers and allow an external device to determine charge times.

THM Input

The MAX8606 monitors the battery temperature with an external NTC thermistor that is in close thermal contact with the battery. Select a thermistor resistance that is 10kΩ at +25°C and has a beta of 3500 Kelvins. The IC compares the resistance from THM to GND and suspends charging when it is greater than 28.3kΩ or less than 3.93kΩ, which translates to a battery temperature of 0°C or +50°C, respectively. Connect THM to GND to disable the temperature control function.

SYS Output

The MAX8606 contains a SYS output that delivers up to $1A_{RMS}$ at 3.5V to 4.2V to power an external system. Bypass SYS to GND with a 4.7µF or larger ceramic capacitor. When V_{BAT} exceeds 3.5V or when the MAX8606 is in suspend mode, the MAX8606 internally connects SYS to BAT through a 50mΩ switch. When charging a battery, the load on SYS is serviced first and

Table 1. $\overline{EN1}$ and $\overline{EN2}$ Control

$\overline{EN1}$	$\overline{EN2}$	MODE
0	0	100mA
0	1	500mA
1	0	8000 x 2.1V / R_{SETI}
1	1	Suspend

the remaining available current goes to charge the battery. SYS is connected to BAT when V_{IN} is not valid.

POK

The MAX8606 contains an open-drain $\overline{POK}$ output that goes low when a valid input source is detected at IN. A valid input source is one whose voltage is between 4V and 5.8V and exceeds the battery voltage by 250mV. After a valid input has been established, charging is sustained with inputs as low as 3.5V as long as the input voltage remains above the battery voltage by at least 55mV. $\overline{POK}$ is high impedance otherwise.

Applications Information

Charge-Current Selection

For USB applications, the charging current is internally limited to 100mA or 500mA. For wall-cube applications requiring a different current requirement, set the charging current with an external resistor from SETI to GND (R_{SETI}). Calculate R_{SETI} as follows:

$$R_{SETI} = 8000 \times 2.1V / (I_{BAT} + I_{SYS})$$

where $\overline{EN1}$ = high and $\overline{EN2}$ = low.

The SETI input also enables the user to monitor the charging current. Under fast-charge operation, the SETI voltage regulates to 1.4V ($\overline{EN1}$ low and $\overline{EN2}$ high) or 2.1V ($\overline{EN1}$ high and $\overline{EN2}$ low). As the charging current decreases, V_{SETI} decreases. This is due to either the thermal regulation control or voltage regulation control (4.2V) of the MAX8606. V_{SETI} is calculated using the following equation:

$$V_{SETI} = (I_{BAT} + I_{SYS}) \times R_{SETI} / 8000$$

Thermal Regulation

The MAX8606 features a thermal limit that reduces the charge current when the die temperature exceeds +100°C. As the temperature increases, the IC lowers the charge current by 50mA/°C above +100°C.

Capacitor Selection

Connect a ceramic capacitor from SYS to GND as close to the IC as possible for proper stability. Use a 4.7µF X5R ceramic capacitor for most applications.

USB/AC Adapter, Li+ Linear Battery Charger with Integrated 50mΩ Battery Switch in TDFN

MAX8606

Connect a 4.7µF ceramic capacitor from IN to GND as close to the IC as possible. Use a larger input bypass capacitor to reduce supply noise.

Thermal Considerations

The MAX8606 is available in a thermally enhanced TDFN package with exposed paddle. Connect the exposed paddle to a large copper ground plane to provide a good thermal contact between the device and the circuit board. The exposed paddle transfers heat away from the device, allowing the MAX8606 to charge the battery with maximum current while minimizing the increase in die temperature.

DC Input Sources

The MAX8606 operates from well-regulated DC sources. The full-charging input voltage range is 4.25V to 5.8V. The device survives input voltages up to 14V without damage to the IC. If V_{IN} is greater than 5.8V (typ), the IC stops charging. An appropriate power supply must provide at least 4.25V when sourcing the desired peak charging current. It also must stay below 5.8V when unloaded.

Application Circuits

Stand-Alone Li+ Charger

The MAX8606 provides a complete Li+ charging solution. Figure 3 shows the MAX8606 as a stand-alone Li+ battery charger. The 23.58kΩ resistor connected to SETI sets a charging current of 712mA (typ). The LED indicates when either prequal or fast-charging has begun. When the battery is charged the LED turns off.

USB Application with AC Adapter

The MAX8606 can be configured for USB applications with an optional AC-adapter input (Figure 4). The p-channel MOSFET disconnects the USB port when the AC adapter is installed. Alternately, the USB port and AC adapter may be excluded from each other by mechanical means, such as using a single connector.

USB-Powered Li+ Charger

The universal serial bus (USB) provides a high-speed serial communication port, as well as power for the remote device. The MAX8606 can be configured to charge a battery at the highest current possible from the host port. Figure 5 shows the MAX8606 as a USB battery charger. To make the circuit compatible with either 100mA or 500mA USB ports, the system software begins at 100mA charging current. The microprocessor then enumerates with the host to determine its current capability. If the host port is capable, the charging current is increased to 475mA to avoid exceeding the 500mA USB specification.

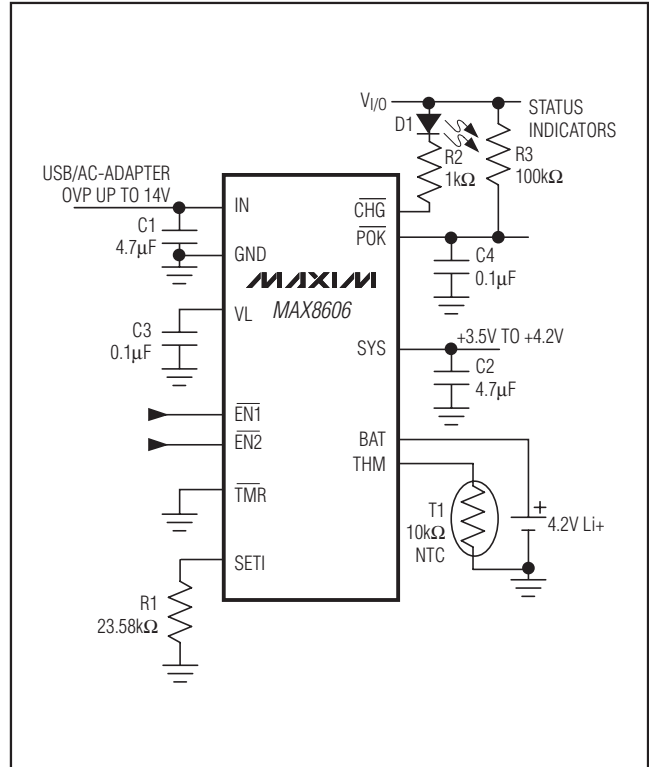

Figure 3. Stand-Alone Application

Layout and Bypassing

Place the input capacitor as close to the device as possible. Provide a large copper ground plane to allow the exposed paddle to sink heat away from the device. Connect the battery to BAT as close to the device as possible to provide accurate battery voltage sensing. Make all high-current traces short and wide to minimize voltage drops. A sample layout is available in the MAX8606 evaluation kit to help speed designs.
