PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Input Capacitance	C_{IN}		5	10	pF	

NOTES:

1. All voltages are referenced to ground.

2. Measured with outputs open.

3. V_{CC} = 5V @25°C. Delays accurate on rising edges within ±2 ns.

4. See Test Conditions below.

5. All output delays in the same speed output tend to vary unidirectionally with temperature or voltage range (i.e., if Out 2 slows down, all other outputs also slow down).

6. Period specifications may be exceeded; however, accuracy will be application-sensitive (decoupling, layout, etc.).

7. t_{PU} = 0 ms for Out 1 through Out 4.

TERMINOLOGY

Period: The time elapsed between the leading edge of the first pulse and the leading edge of the following pulse.

t_{WI} (Pulse Width): The elapsed time on the pulse between the 1.5V point on the leading edge and the 1.5V point on the trailing edge, or the 1.5V point on the trailing edge and the 1.5V point on the leading edge.

t_{RISE} (Input Rise Time): The elapsed time between the 20% and the 80% point on the leading edge of the input pulse.

t_{FALL} (Input Fall Time): The elapsed time between the 80% and the 20% point on the trailing edge of the input pulse.

t_{PLH} (Time Delay, Rising): The elapsed time between the 1.5V point on the leading edge of the input pulse and the 1.5V point on the leading edge of the corresponding output pulse.

TEST SETUP DESCRIPTION

Figure 3 illustrates the hardware configuration used for measuring the timing parameters on the DS1007. The input waveform is produced by a precision pulse generator under software control. Time delays are measured by a time interval counter (20 ps resolution) connected between the input and each output. Each output is selected and connected to the counter by a VHF switch control unit. All measurements are fully automated, with each instrument controlled by a central computer over an IEEE 488 bus.

TEST CONDITIONS

INPUT:

Ambient Temperature:	25°C ± 3°C
Supply Voltage (V_{CC}):	5.0V ± 0.1V
Input Pulse:	High = 3.0V ± 0.1V
	Low = 0.0V ± 0.1V
Source Impedance:	50 ohm max.
Rise and Fall Time:	3.0 ns max.
Pulse Width:	500 ns
Period:	1 µs

OUTPUT:

Each output is loaded with the equivalent of one 74F04 input gate. Delay is measured at the 1.5V level on the rising edge.

NOTE:

Above conditions are for test only and do not restrict the operation of the device under other data sheet conditions.
