Low-Voltage 3.5 Ω , SPDT, CMOS Analog Switches

ABSOLUTE MAXIMUM RATINGS

| (All voltages referenced to ground.) | |
|--------------------------------------|-------------|
| V+, IN | 0.3V to +6V |
| COM, NO, NC (Note 1) | |
| Continuous Current (IN, V+, GND) | ±30mA |
| Continuous Current (COM, NO, NC) | |
| Peak Current COM, NO, NC | |
| (Pulsed at 1ms, 10% Duty Cycle) | ±150mA |

| Continuous Power Dissipation ($I_A = +70^{\circ}C$) | |
|---|----------------|
| μDFN (derate 2.1mW/°C above +70°C) | 168mW |
| SC70 (derate 3.1mW/°C above +70°C) | 245mW |
| Operating Temperature Range | 40°C to +85°C |
| Maximum Junction Temperature | +150°C |
| Storage Temperature Range | 65°C to +150°C |
| Lead Temperature (soldering, 10s) | +300°C |
| Soldering Temperature (reflow) | +260°C |
| | |

Note 1: Signals on NO, NC, or COM exceeding V+ or GND are clamped by internal diodes. Signals on IN exceeding GND are clamped by an internal diode. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

 $(V+=+2.7V \text{ to } +3.6V, V_{IH}=+2.0V, V_{IL}=+0.4V, T_A=-40^{\circ}C \text{ to } +85^{\circ}C, \text{ unless otherwise noted.}$ Typical values are at $T_A=+25^{\circ}C.$) (Note 2)

- Note 2: SC70 and μDFN parts are 100% tested at T_A = +25°C. Limits across the full-temperature range are guaranteed by design and correlation.
- **Note 3:** $\Delta R_{ON} = R_{ON(MAX)} R_{ON(MIN)}$.
- **Note 4:** RoN flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.
- Note 5: Guaranteed by design.
- **Note 6:** µDFN is guaranteed by design.
- Note 7: Off-Isolation = 20log10 (VO / VI), where VO is V_{COM} and VI is either V_{NC} or V_{NO} from the network analyzer.
- Note 8: Crosstalk is measured between the two switches.

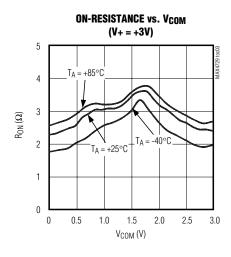

Low-Voltage 3.5 Ω , SPDT, CMOS Analog Switches

Detailed Description

The MAX4729/MAX4730 single-pole/double-throw (SPDT) switches operate from a single supply ranging from +1.8V to +5.5V. These switches provide low 3.5Ω on-resistance (RoN), as well as 0.45Ω RoN flatness with a 2.7V supply. These devices typically consume only 1nA of supply current, making them suitable for use in low-power, portable applications. The MAX4729/MAX4730 feature low-leakage currents over the entire temperature range, TTL/CMOS-compatible digital logic, and excellent AC characteristics.

Applications Information

Digital Control Inputs

The MAX4729/MAX4730 logic inputs accept up to +5.5V, regardless of supply voltage. For example, with a +3.3V

supply, IN can be driven low to GND and high to +5.5V, allowing for mixing of logic levels in a system. With a 2.7V to 3.6V power-supply voltage range, the logic thresholds are set so $V_{IL} = 0.4V$ (max) and $V_{IH} = 2V$ (min).

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the device. Proper power-supply sequencing is recommended for all CMOS devices. Always apply V+ before applying analog signals, especially if the analog signal is not current limited.
