

Functional description

The AS7C164 is a high performance CMOS 65,536-bit Static Random Access Memory (SRAM) device organized as 8,192 words \times 8 bits. It is designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times (t_{AA} , t_{RC} , t_{WC}) of 12/15/20 ns with output enable access times (t_{OE}) of 6/7/8 ns are ideal for high performance applications. Active high and low chip enables ($\overline{CE1}$, CE2) permit easy memory expansion with multiple-bank memory systems.

When $\overline{CE1}$ is High or CE2 is Low the device enters standby mode. The standard AS7C164 is guaranteed not to exceed 11.0 mW power consumption in standby mode, and typically requires only 250 μ W; it offers 2.0V data retention with maximum power of 120 μ W.

A write cycle is accomplished by asserting write enable (\overline{WE}) and both chip enables ($\overline{CE1}$, CE2). Data on the input pins I/O0-I/O7 is written on the rising edge of \overline{WE} (write cycle 1) or the active-to-inactive edge of $\overline{CE1}$ or CE2 (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable (\overline{OE}) or write enable (\overline{WE}).

A read cycle is accomplished by asserting output enable (\overline{OE}) and both chip enables ($\overline{CE1}$, CE2), with write enable (\overline{WE}) High. The chip drives I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible, and operation is from a single 5V supply. The AS7C164 is packaged in 300 mil SOJ packages.

Absolute maximum ratings

Parameter	Device	Symbol	Min	Max	Unit
Voltage on V_{CC} relative to GND	AS7C164	V_{t1}	-0.50	+7.0	V
Voltage on any pin relative to GND		V_{t2}	-0.50	$V_{CC} + 0.50$	V
Power dissipation		P_D	-	1.0	W
Storage temperature (plastic)		T_{stg}	-65	+150	$^{\circ}$ C
Ambient temperature with V_{CC} applied		T_{bias}	-55	+125	$^{\circ}$ C
DC current into outputs (low)		I_{out}	-	20	mA

NOTE: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Truth table

$\overline{CE1}$	CE2	\overline{WE}	\overline{OE}	Data	Mode
H	X	X	X	High Z	Standby (I_{SB} , I_{SB1})
X	L	X	X	High Z	Standby (I_{SB} , I_{SB1})
L	H	H	H	High Z	Output disable (I_{CC})
L	H	H	L	D_{out}	Read (I_{CC})
L	H	L	X	D_{in}	Write (I_{CC})

Key: X = Don't Care, L = Low, H = High

Recommended operating conditions

Parameter	Device	Symbol	Min	Typical	Max	Unit
Supply voltage	AS7C164	V_{CC}	4.5	5.0	5.5	V
Input voltage	AS7C164	V_{IH}	2.2	–	$V_{CC}+1$	V
		V_{IL}	-0.5*	–	0.8	V
Ambient operating temperature	AS7C164	T_A	0	–	70	°C

* $V_{IL, min} = -3.0V$ for pulse width less than $t_{RC}/2$.

Operation recovery time	t_R		t_{RC}	–	ns

Data retention waveform

AC test conditions

- Output load: see Figure B or Figure C.
- Input pulse level: GND to 3.0V. See Figure A.
- Input rise and fall times: 2 ns. See Figure A.
- Input and output timing reference levels: 1.5V.

Figure A: Input pulse

Figure B: 5V Output load

Figure C: 3.3V Output load

Notes

- 1 During V_{CC} power-up, a pull-up resistor to V_{CC} on $\overline{CE1}$ is required to meet I_{SB} specification.
- 2 This parameter is sampled, but not 100% tested.
- 3 For test conditions, see AC Test Conditions, Figures A, B, and C.
- 4 t_{CLZ} and t_{CHZ} are specified with $C_L = 5pF$ as in Figures B or C. Transition is measured $\pm 500mV$ from steady-state voltage.
- 5 This parameter is guaranteed, but not 100% tested.
- 6 \overline{WE} is High for read cycle.
- 7 $\overline{CE1}$ and \overline{OE} are Low and $CE2$ is High for read cycle.
- 8 Address valid prior to or coincident with $\overline{CE1}$ transition Low and $CE2$ transition High.
- 9 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 10 $\overline{CE1}$ or \overline{WE} must be High or $CE2$ Low during address transitions. Either \overline{CE} or \overline{WE} asserting high terminates a write cycle.
- 11 All write cycle timings are referenced from the last valid address to the first transitioning address.
- 12 $\overline{CE1}$ and $CE2$ have identical timing
- 13 2V data retention applies to the commercial operating range only.
- 14 $C = 30pF$, except on High Z and Low Z parameters, where $C = 5pF$.
