Quad, SPST, Ultra-Low Leakage, CMOS Analog Switches

ABSOLUTE MAXIMUM RATINGS

V+ to V- ..... +44V
V_{IN} to GND ..... V, V+
V_S, V_D (Note 1) ..... (V- - 0.3V) to (V+ + 0.3V)
V+ to GND (V- = 0V ..... +40V
Current (any terminal, except S or D) 30mA
Continuous Current, S or D 20mA
Peak Current, S or D 70mA
(pulsed at 1ms, 10% duty cycle max)
Continuous Total Power Dissipitaition (Note 2)
16-Pin Plastic DIP (derate 7.5mW/°C above +70°C) 470mW
16-Pin QSOP (derate 9.52mW/°C above +70°C 762mW
16-Pin Narrow SO (derate 10mW/°C above +70°C) 400mW
16-Pin CERDIP (derate 10mW/°C above +70°C) 900mW

Operating Temperature Ranges:
MAX32_C_ _ ..... 0°C to +70°C
MAX32_E_ _ ..... -40°C to +85°C
MAX32_MJE ..... -55°C to +125°C
Storage Temperature Range ..... -65°C to +150°C
Lead Temperature (soldering, 10 sec) ..... +300°C

Note 1: Exceeding this limit is acceptable as long as the S or D current is less than 20mA.
Note 2: All leads soldering or welding to PC board.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V+ = 15V, V- = -15V, T_A = +25°C, unless otherwise noted.)

Source-Off Capacitance	$C_{S(OFF)}$	V_S = 0V, V_{IN} = 5V, f = 1MHz		1.7			1.7		pF
Drain-Off Capacitance	$C_{D(OFF)}$	V_S = 0V, V_{IN} = 5V, f = 1MHz		1.7			1.7		pF
Channel-On Capacitance	$C_{D(ON)}$ + $C_{S(ON)}$	V_D = V_S = 0V, V_{IN} = 0V, f = 1MHz		6			6		pF

Note 3: All leakage parameters are 100% tested at maximum rated operating temperatures, i.e. +70°C, +85°C, or +125°C, and guaranteed by correlation at +25°C.

Note 4: Electrical characteristics, such as $r_{DS(ON)}$, will change when power supplies other than ±15V are used. Power-supply range is a design characteristic, not production tested.

Note 5: Guaranteed by design.

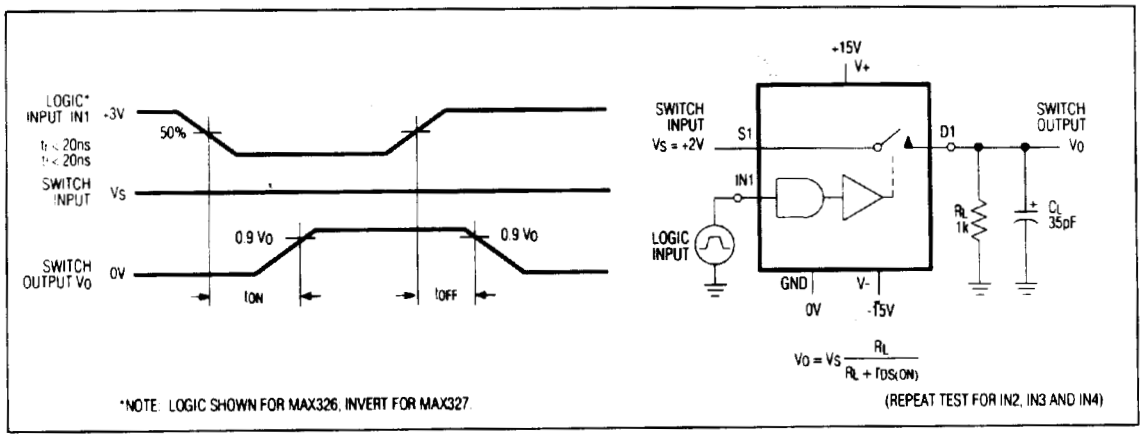

Figure 1. Switching-Time Test Circuit. Switch-output waveform shown for V_S = constant with logic-input waveform as shown. Note: V_S may be positive or negative as per switching-time test circuit. V_O is the steady-state output with switch on. Feedthrough via gate capacitance may result in spikes at leading and trailing edge of output waveform.

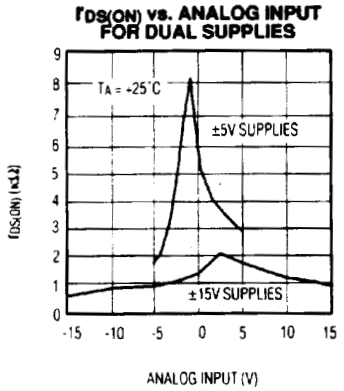
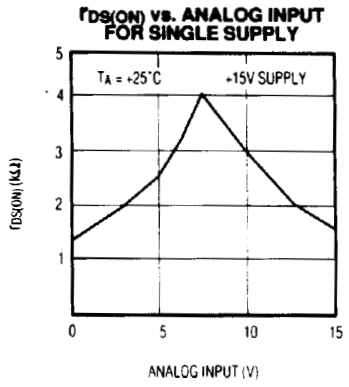
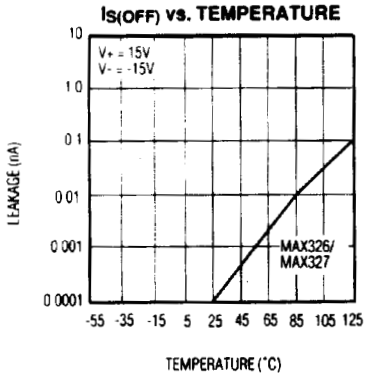
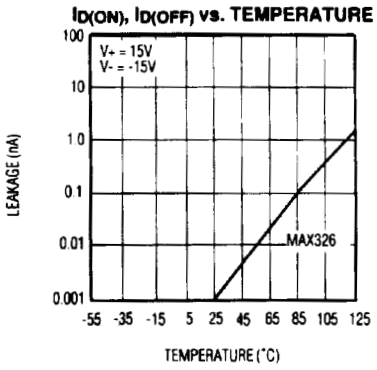
Quad, SPST, Ultra-Low Leakage, CMOS Analog Switches

Typical Operating Characteristics









Application Hints

The MAX326/MAX327 are pin-compatible upgrades for the DG201A/DG202 and DG211/DG212. The MAX326/MAX327 feature significantly lower leakages (at least 100 times less at +25°C), but with higher on resistance. Low leakage minimizes signal error in most applications that require signal switching into high-impedance inputs of A/Ds or op amps. Switching times are virtually identical, as shown in Table 1.

Table 1. Switching Speeds with Various Power-Supply Combinations

POWER SUPPLY (V)	t_{ON} (µs)	tOFF (ns)
±15	0.5	50
±10	1	80
±5	2.5	200
+10	2.5	200
+15	1.5	100

The MAX326/MAX327 work well in single-supply applications from +10V to +30V. For these applications, V- should be connected to ground, and signal levels equal to the rail can be switched. ±5V to ±18V dual supplies can also be used to increase design flexibility.

Channel-to-channel on-resistance matching is typically better than 95% for a given analog input level. *Typical Operating Characteristics* show how $r_{DS(ON)}$ changes with various analog inputs and power-supply combinations.

While specified at TTL threshold levels, the logic threshold is roughly 1.5V ±0.2V and switches properly with CMOS input levels from -15V to +15V. Logic input levels should never be allowed to exceed the supply rails.

Protecting Against Fault Conditions

Fault conditions develop when power supplies are turned off with input signals still present, or when overvoltages occur at the inputs during normal operation. In either case, source-to-body diodes can be forward biased to conduct current from the signal source. If low current levels are required, the addition of external protection diodes is recommended (Figure 2).

To provide protection for overvoltages up to 20V above the supply rails, a 1N4001 or 1N914 diode should be placed in series with the positive and negative supplies (Figure 2). The addition of these diodes will reduce the analog signal range to 1V below the positive supply and 1V above the negative supply.

For signals that can be momentarily shorted to the 110VAC line, the addition of a 47kΩ, 1/2W resistor in series with the channel input is recommended. This will protect the switch and allow normal operation to continue once the fault condition abates. The throughput resistance will then be 47kΩ plus $r_{DS(ON)}$, but low switch leakage will reduce the error while maintaining superior system reliability.
