8th-Order, Lowpass, Butterworth, Switched-Capacitor Filter

ABSOLUTE MAXIMUM RATINGS

V_{DD} to GND .....-0.3V to +6V
IN, OUT, COM, OS, CLK .....-0.3V to (V_{DD} + 0.3V)
$\overline{SHDN}$.....-0.3V to +6V
OUT Short-Circuit Duration.....1sec
Continuous Power Dissipation (T_A = +70°C)
8-Pin SO (derate 5.88mW/°C above +70°C).....471mW
8-Pin DIP (derate 9.09mW/°C above +70°C).....727mW

Operating Temperature Range .....-40°C to +85°C
Storage Temperature Range .....-65°C to +150°C
Lead Temperature (soldering, 10sec) .....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{DD} = +5V, filter output measured at OUT, 10kΩ || 50pF load to GND at OUT, OS = COM, 0.1µF from COM to GND, $\overline{SHDN}$ = V_{DD}, f_{CLK} = 100kHz, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
FILTER CHARACTERISTICS						
Corner Frequency	f_C	(Note 1)		0.001 to 2		kHz
Clock-to-Corner Ratio	f_{CLK} / f_C			100:1

Output Voltage Range			0.25		V_{DD} - 0.25	V
Output Offset Voltage	V_{OFFSET}	V_{IN} = V_{COM} = V_{DD} / 2		±5	±25	mV
DC Insertion Gain with Output Offset Removed		V_{COM} = V_{DD} / 2 (Note 2)	-0.1	0.15	0.3	dB
Total Harmonic Distortion plus Noise	THD+N	f_{IN} = 200Hz, V_{IN} = 4Vp-p, measurement bandwidth = 22kHz		-73		dB
OS Voltage Gain to OUT	A_{OS}			1		V/V
Input Voltage Range at OS	V_{OS}			V_{COM} ±0.1		V
COM Voltage Range	V_{COM}	Input, COM externally driven	V_{DD} / 2 - 0.5	V_{DD} / 2	V_{DD} / 2 + 0.5	V
		Output, COM internally biased	V_{DD} / 2 - 0.2	V_{DD} / 2	V_{DD} / 2 + 0.2	
Input Resistance at COM	R_{COM}		75	125		kΩ
Clock Feedthrough				10		mVp-p
Resistive Output Load Drive	R_L		10	1		kΩ
Maximum Capacitive Load at OUT	C_L		50	500		pF
Input Leakage Current at COM		$\overline{SHDN}$ = GND, V_{COM} = 0 to V_{DD}		±0.1	±10	µA
Input Leakage Current at OS		V_{OS} = 0 to (V_{DD} - 1V) (Note 3)		±0.1	±10	µA
CLOCK						
Internal Oscillator Frequency	f_{OSC}	C_{OSC} = 1000pF (Note 4)	40	53	67	kHz
Clock Input Current	I_{CLK}	V_{CLK} = 0 or 5V		±24	±40	µA
Clock Input High	V_{IH}		V_{DD} - 0.5			V
Clock Input Low	V_{IL}				0.5	V

ELECTRICAL CHARACTERISTICS (continued)

(V_{DD} = +5V, filter output measured at OUT, 10kΩ || 50pF load to GND at OUT, OS = COM, 0.1µF from COM to GND, $\overline{SHDN}$ = V_{DD}, f_{CLK} = 100kHz, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
POWER REQUIREMENTS						
Supply Voltage	V_{DD}		4.5		5.5	V
Supply Current	I_{DD}	Operating mode, no load, IN = OS = COM		2.9	3.5	mA
Shutdown Current	$I_{\overline{SHDN}}$	$\overline{SHDN}$ = GND, CLK driven from 0 to V_{DD}		0.2	1	µA
Power-Supply Rejection Ratio	PSRR	Measured at DC		60		dB
SHUTDOWN						
$\overline{SHDN}$ Input High	V_{SDH}		V_{DD} - 0.5			V
$\overline{SHDN}$ Input Low	V_{SDL}				0.5	V
$\overline{SHDN}$ Input Leakage Current		$V_{\overline{SHDN}}$ = 0 to V_{DD}		±0.1	±10	µA

FILTER CHARACTERISTICS

(V_{DD} = +5V, filter output measured at OUT, 10kΩ || 50pF load to GND at OUT, $\overline{SHDN}$ = V_{DD}, V_{COM} = V_{OS} = V_{DD}/2, f_{CLK} = 100kHz, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
Insertion Gain Relative to DC Gain	f_{IN} = 0.5f_C	-0.1	0.0		dB
	f_{IN} = f_C	-3.5	-3.0	-2.5	
	f_{IN} = 2f_C		-48	-43	
	f_{IN} = 3f_C		-76	-70	

Note 1: The maximum f_C is defined as the clock frequency f_{CLK} = 100 • f_C at which the peak SINAD drops to 68dB with a sinusoidal input at 0.2f_C.

Note 2: DC insertion gain is defined as $\Delta V_{OUT} / \Delta V_{IN}$.

Note 3: OS voltages above V_{DD} - 1V saturate the input and result in a 75µA typical input leakage current.

Note 4: f_{OSC} (kHz) ≅ 53 • 10^3 / C_{OSC} (pF).

Pin Description

PIN	NAME	FUNCTION
1	COM	Common Input Pin. Biased internally at mid-supply. Bypass externally to GND with a 0.1µF capacitor. To override internal biasing, drive with an external supply.
2	IN	Filter Input
3	GND	Ground
4	V_{DD}	+5V Supply Input
5	OUT	Filter Output
6	OS	Offset Adjust Input. To adjust output offset, bias OS externally. Connect OS to COM if no offset adjustment is needed. Refer to *Offset and Common-Mode Input Adjustment* section.
7	$\overline{SHDN}$	Shutdown Input. Drive low to enable shutdown mode; drive high or connect to V_{DD} for normal operation.
8	CLK	Clock Input. To override the internal oscillator, connect to an external clock; otherwise, connect an external capacitor (C_{OSC}) from CLK to GND to set the internal oscillator frequency.

Detailed Description

The MAX7480 Butterworth filter operates with a 100:1 clock-to-corner frequency ratio and a 2kHz maximum corner frequency.

Lowpass Butterworth filters provide a maximally flat passband response, making them ideal for instrumentation applications that require minimum deviation from the DC gain throughout the passband.

Figure 1 shows the difference between Bessel and Butterworth filter frequency responses. With the filter cutoff frequencies set at 1kHz, trace A shows the Bessel filter response and trace B shows the Butterworth filter response.

Background Information

Most switched-capacitor filters (SCFs) are designed with biquadratic sections. Each section implements two filtering poles, and the sections are cascaded to produce higher-order filters. The advantage to this approach is ease of design. However, this type of design is highly sensitive to component variations if any section's Q is high. An alternative approach is to emulate a passive network using switched-capacitor integrators with summing and scaling. Figure 2 shows a basic 8th-order ladder filter structure.

A switched-capacitor filter such as the MAX7480 emulates a passive ladder filter. The filter's component sensitivity is low when compared to a cascaded biquad design, because each component affects the entire filter shape, not just one pole-zero pair. In other words, a mismatched component in a biquad design will have a concentrated error on its respective poles, while the same mismatch in a ladder filter design results in an error distributed over all poles.

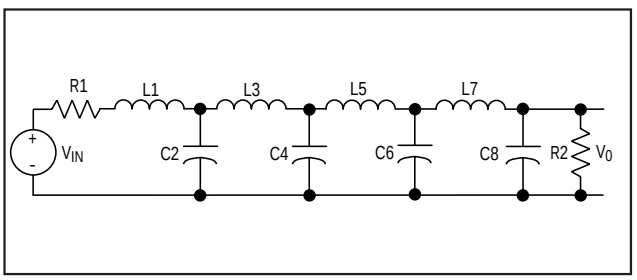

Figure 2. 8th-Order Ladder Filter Network

Clock Signal

External Clock

The MAX7480 SCF is designed for use with external clocks that have a 40% to 60% duty cycle. When using an external clock with these devices, drive CLK with a CMOS gate powered from 0 to V_{DD}. Varying the rate of the external clock adjusts the corner frequency of the filter as follows:

$$f_C = f_{CLK} / 100$$

Internal Clock

When using the internal oscillator, connect a capacitor (C_{OSC}) between CLK and ground. The value of the capacitor determines the oscillator frequency as follows:

$$f_{OSC}(kHz) = \frac{53 \cdot 10^3}{C_{OSC}}; C_{OSC} \text{ in pF}$$

Minimize the stray capacitance at CLK so that it does not affect the internal oscillator frequency. Vary the rate of the internal oscillator to adjust the filter's corner frequency by a 100:1 clock to corner-frequency ratio. For example, an internal oscillator frequency of 100kHz produces a nominal corner frequency of 1kHz.

Input Impedance vs. Clock Frequencies

The MAX7480's input impedance is effectively that of a switched-capacitor resistor, and is inversely proportional to frequency. The input impedance values determined below represent the average input impedance, since the input current is not continuous. As a rule, use a driver with an output impedance less than 10% of the filter's input impedance. Estimate the input impedance of the filter using the following formula:

$$Z_{IN} = \frac{1}{(f_{CLK} \cdot C_{IN})}$$

where f_{CLK} = clock frequency and C_{IN} = 2.31pF.

Low-Power Shutdown Mode

This device features a shutdown mode that is activated by driving $\overline{SHDN}$ low. In shutdown mode, the filter's supply current reduces to 0.2µA (typ) and its output becomes high impedance. For normal operation, drive $\overline{SHDN}$ high or connect to V_{DD}.

Applications Information

Offset and Common-Mode Input Adjustment

The voltage at COM sets the common-mode input voltage and is biased at mid-supply with an internal resistor-divider. Bypass COM with a 0.1µF capacitor and connect OS to COM. For applications requiring offset adjustment or DC level shifting, apply an external bias voltage through a resistor-divider network to OS, as shown in Figure 3. (Note: Do not leave OS unconnected.) The output voltage is represented by this equation:

$$V_{OUT} = (V_{IN} - V_{COM}) + V_{OS}$$

with $V_{COM} = V_{DD} / 2$ (typical), where ($V_{IN} - V_{COM}$) is lowpass-filtered by the SCF and VOS is added at the output stage. See the *Electrical Characteristics* for the voltage range of COM and OS. Changing the voltage on COM or OS significantly from mid-supply reduces the filter's dynamic range.

Power Supplies

The MAX7480 operates from a single +5V supply. Bypass V_{DD} to GND with a 0.1µF capacitor. If dual supplies (±2.5V) are required, connect COM to system ground and connect GND to the negative supply. Figure 4 shows an example of dual-supply operation. Single- and dual-supply performances are equivalent. For either single- or dual-supply operation, drive CLK and $\overline{SHDN}$ from GND (V- in dual-supply operation) to V_{DD}. For ±5V dual-supply applications, use the MAX291–MAX297.

Input Signal Amplitude Range

The optimal input signal range is determined by observing the voltage level at which the total harmonic distortion plus noise (THD+N) is minimized for a given corner frequency. The *Typical Operating Characteristics* shows a graph of the device's THD+N response as the input signal's peak-to-peak amplitude is varied. This measurement is made with OS and COM biased at mid-supply.

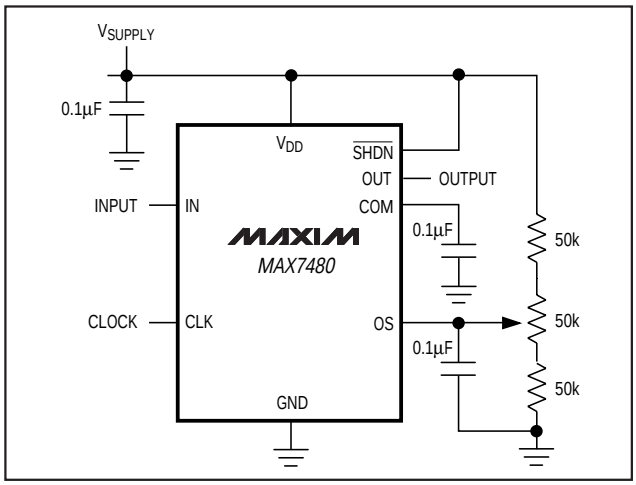

Figure 3. Offset Adjustment Circuit

8th-Order, Lowpass, Butterworth, Switched-Capacitor Filter

Anti-Aliasing and Post-DAC Filtering

When using the MAX7480 for anti-aliasing or post-DAC filtering, synchronize the DAC and the filter clocks. If the clocks are not synchronized, beat frequencies may alias into the passband.

The high clock-to-corner frequency ratio (100:1) also eases the requirements of pre- and post-SCF filtering. At the input, a lowpass filter prevents the aliasing of frequencies around the clock frequency into the passband. At the output, a lowpass filter attenuates the clock feedthrough.

A high clock to corner-frequency ratio allows a simple RC lowpass filter, with the cutoff frequency set above the SCF corner frequency to provide input anti-aliasing and reasonable output clock attenuation.

Harmonic Distortion

Harmonic distortion arises from nonlinearities within the filter. These nonlinearities generate harmonics when a pure sine wave is applied to the filter input. Table 1 lists the MAX7480's typical harmonic-distortion values with a 10kΩ load at T_A = +25°C.

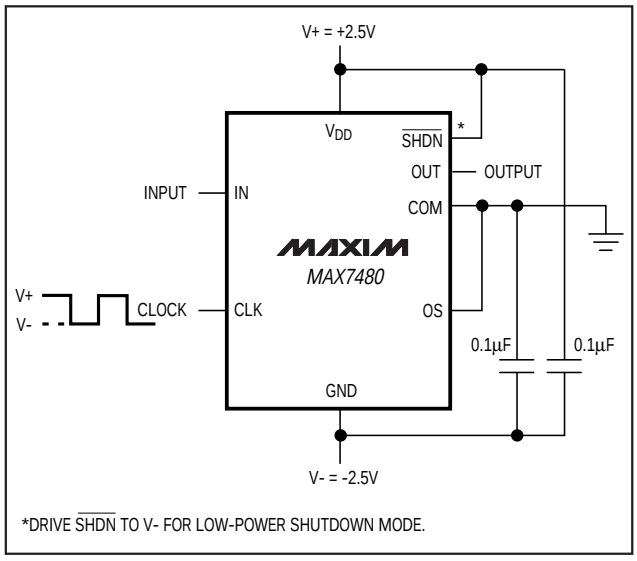

Figure 4. Dual-Supply Operation

Table 1. Typical Harmonic Distortion

FILTER	f_{CLK} (kHz)	f_C (kHz)	f_{IN} (Hz)	V_{IN} (Vp-p)	TYPICAL HARMONIC DISTORTION (dB)			
					2nd	3rd	4th	5th
MAX7480	100	1	200	4	-89	-73	-91	-93
	200	2	400		-82	-68	-85	-89
