Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	CLK	Output	Clock output from VCO. Output frequency equals the input frequency times multiplier.
2	VDDP	Power	Supply pin for CLK output buffer. Sets output clock amplitude. Connect to 2.5V or 3.3V.
3	VDD	Power	Connect to +3.3V or +5V. Must match other VDDs.
4	VDD	Power	Connect to +3.3V or +5V. Must match other VDDs.
5	VDD	Power	Connect to +3.3V or +5V. Must match other VDDs.
6	X2	XO	Crystal connection. Connect to a 10 - 27 MHz fundamental parallel mode crystal.
7	S1	Input	Multiplier select pin 1. Determines CLK output per table above. Internal pull-up.
8	X1/ICLK	XI	Crystal connection. Connect to a 10-27 MHz fundamental parallel mode crystal, or clock.
9	S2	Input	Multiplier select pin 2. Determines CLK output per table above. Internal pull-up.
10	S3	Input	Multiplier select pin 3. Determines CLK output per table above. Internal pull-up.
11	S0	Input	Multiplier select pin 0. Determines CLK output per table above. Internal pull-up.
12	OE	Input	Output Enable. Tri-states the output clock when low. Internal pull-up.
13	GND	Power	Connect to ground.
14	GND	Power	Connect to ground.
15	GND	Power	Connect to ground.
16	GND	Power	Connect to ground.

Achieving Low Phase Noise

Figure 1 shows a typical phase noise measurement in a 125 MHz system. There are a few simple steps that can be taken to achieve these levels of phase noise from the ICS601-02. Variations in VDD will increase the phase noise, so it is important to have a stable, low noise supply voltage at the device. Use decoupling capacitors of 0.1 µF in parallel with 0.01 µF. It is important to have these capacitors as close as possible to the ICS601-02 supply pins.

Disabling the REFOUT clock is also important for achieving low phase noise; lab tests have shown that this can reduce the phase noise by as much as 10 dBc/Hz.

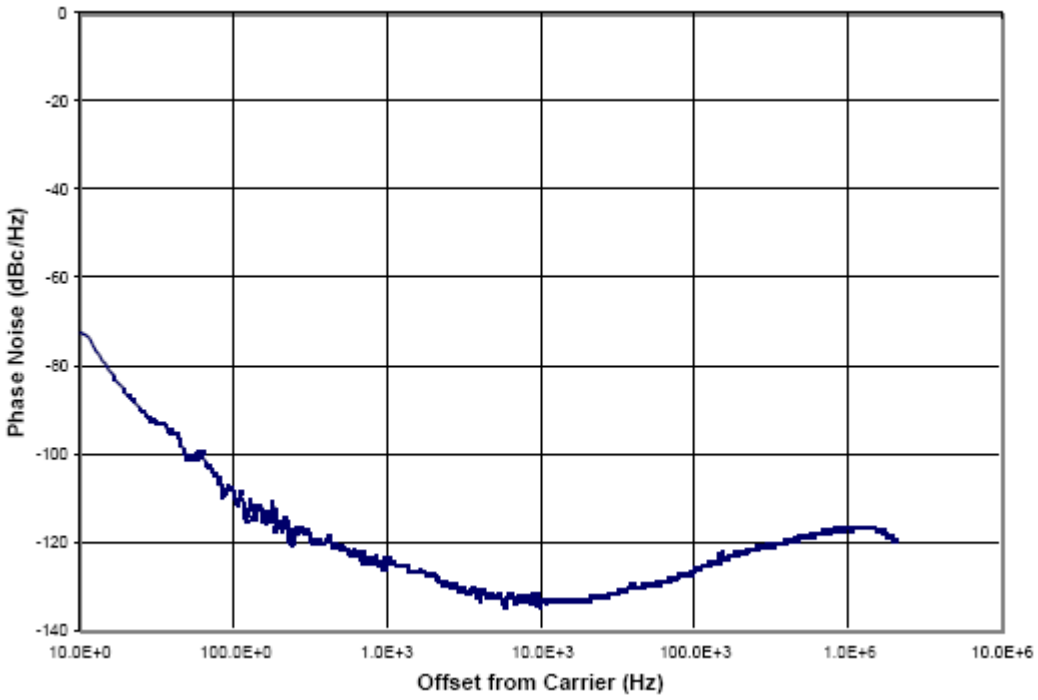

Figure 1: Phase Noise of ICS601-02 at 125 MHz out, 25 MHz crystal input, VDD=3.3 V.

External Components

The ICS601-02 requires a minimum number of external components for proper operation. Decoupling capacitors of 0.01 µF and 0.1 µF should be connected between VDD and GND, as close to the part as possible. A series termination resistor of 33 Ω may be used for the clock output. The crystal must be connected as close to the chip as possible. The crystal should be fundamental mode, parallel resonant. Do not use third overtone. For exact tuning when using a crystal, capacitors should be connected from pins X1 to ground and X2 to ground. In general, the value of these capacitors is given by the following equation, where CL is the crystal load capacitance: Crystal caps (pF) = (CL-5) x 2. So for a crystal with 16 pF load capacitance, two 22 pF caps can be used.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS601-02. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Item	Rating
Supply Voltage, VDD (referenced to ground)	7 V
All Inputs and Outputs (referenced to ground)	-0.5 V to VDD+0.5 V
Storage Temperature	-65 to +150° C
Soldering Temperature	260° C
Ambient Operating Temperature (industrial)	-40 to +85°C

DC Electrical Characteristics
