Output Current (RESET, $\overline{\text{RESET}}$ ).....	20mA
Rate of Rise (V <sub>CC</sub> ).....	100V/μs

Continuous Power Dissipation (T<sub>A</sub> = +70°C)

3-Pin SC70 (derate 2.7mW/°C above +70°C).....	174mW
3-Pin SOT23 (derate 4mW/°C above +70°C).....	320mW
Operating Temperature Range.....	-40°C to +85°C
Storage Temperature Range.....	-65°C to +150°C
Lead Temperature (soldering, 10s).....	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 3-Pin, Ultra-Low-Power SC70/SOT $\mu$ P Reset Circuits

### Applications Information

#### Interfacing to $\mu$ Ps with Bidirectional Reset Pins

Since the  $\overline{\text{RESET}}$  output on the MAX6328/MAX6348 is open drain, these devices interface easily with microprocessors ( $\mu$ Ps) that have bidirectional reset pins, such as the Motorola 68HC11. Connecting the  $\mu$ P supervisor's  $\overline{\text{RESET}}$  output directly to the microcontroller's ( $\mu$ C's)  $\overline{\text{RESET}}$  pin with a single pull-up resistor allows either device to assert reset (Figure 1).

#### Negative-Going $V_{CC}$ Transients

In addition to issuing a reset to the  $\mu$ P during power-up, power-down, and brownout conditions, these devices are relatively immune to short-duration, negative-going  $V_{CC}$  transients (glitches).

The *Typical Operating Characteristics* show the Maximum Transient Duration vs. Reset Threshold Overdrive graph, for which reset pulses are not generated. The graph shows the maximum pulse width that a negative-going  $V_{CC}$  transient may typically have when issuing a reset signal. As the amplitude of the transient increases, the maximum allowable pulse width decreases.
