MAX1323x Operating Temperature Range ..	-40°C to +105°C
Storage Temperature Range .....	-65°C to +160°C
Lead Temperature (soldering, 10s) .....	+300°C

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### Electrical Characteristics

## Pin Descriptions

PIN			NAME	FUNCTION
MAX13234E/ MAX13235E		MAX13236E/ MAX13237E		
TSSOP	TQFN-EP	TQFN-EP		
1	19	14	READY	Ready to Transmit Output, Active-High. READY is enabled high when V- goes below -4V and the device is ready to transmit.
2	1	16	C1+	Positive Terminal of the Voltage Doubler Charge-Pump Capacitor
3	20	15	V+	+5.5V Generated by the Charge Pump
4	2	1	C1-	Negative Terminal of the Voltage Doubler Charge-Pump Capacitor
5	3	2	C2+	Positive Terminal of the Inverting Charge-Pump Capacitor
6	4	3	C2-	Negative Terminal of the Inverting Charge-Pump Capacitor
7	5	4	V-	-5.5V Generated by the Charge Pump
8	6	—	T2OUT	RS-232 Transmitter Output 2
—	—	5	RIN	RS-232 Receiver Input
9	7	—	R2IN	RS-232 Receiver Input 2
—	—	6	ROUT	CMOS Receiver Output. $V_L$ referred logic.
10	8	—	R2OUT	CMOS Receiver Output 2. $V_L$ referred logic.
11	9	7	$V_L$	Logic-Level Supply. All CMOS inputs and outputs are related to this supply.
—	—	8	TIN	CMOS Transmitter Input. $V_L$ referred logic.
12	10	—	T2IN	CMOS Transmitter Input 2. $V_L$ referred logic.
13	11	—	T1IN	CMOS Transmitter Input 1. $V_L$ referred logic.
14	12	9	FORCEON	FORCEON Input, Active-High. $V_L$ referenced logic. Drive FORCEON high to override automatic circuitry keeping transmitters on ( $\overline{\text{FORCEOFF}}$ must be high). See Table 1.
15	13	—	R1OUT	CMOS Receiver Output 1. $V_L$ referred logic.
—	—	10	TOUT	RS-232 Transmitter Output
16	14	—	R1IN	RS-232 Receiver Input 1
17	15	—	T1OUT	RS-232 Transmitter Output 1
18	16	11	GND	Ground
19	17	12	VCC	+3V to +5.5V Supply Voltage
20	18	13	$\overline{\text{FORCEOFF}}$	$\overline{\text{FORCEOFF}}$ Input, Active-Low. $V_L$ referenced logic. Drive $\overline{\text{FORCEOFF}}$ low to shut down transmitters and on-board charge pumps. All receiver and transmitter outputs are tri-stated. This overrides all automatic circuitry and FORCEON (Table 1).
—	—	—	EP	Exposed Pad. Connect EP to GND or leave unconnected.

## Detailed Description

### VL Logic Supply Input

The MAX13234E–MAX13237E feature a separate logic supply input ( $V_L$ ) that sets the receiver's output level ( $V_{OH}$ ), and sets the transmitter's input thresholds ( $V_{IL}$ ,  $V_{IH}$ ). This feature allows flexibility in interfacing to UARTs or communication controllers that have different logic levels. Connect this input to the host logic supply ( $1.62V \leq V_L \leq V_{CC}$ ).

### Dual Charge-Pump Voltage Converter

The internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V and -5.5V (inverting charge pump), over the +3.0V to +5.5V range. The charge pump operates in discontinuous mode: if the output voltages are less than +5.5V, the charge pump is enabled; if the output voltages exceed +5.5V, the charge-pump is disabled. The charge pumps require flying capacitors (C1, C2) and reservoir capacitors (C3, C4) to generate the  $V_+$  and  $V_-$  supplies. The READY output is low when the charge pumps are disabled in shutdown mode. The READY signal asserts high when  $V_-$  goes below -4V.

### RS-232 Transmitters

The transmitters are inverting level translators that convert CMOS-logic levels to ±5.0V EIA/TIA-232 levels. The MAX13234E/MAX13236E guarantee a 250kbps data rate with worst-case loads of 3kΩ in parallel with 1000pF. The MAX13235E/MAX13237E guarantee a 1Mbps data rate with worst-case loads of 3kΩ in parallel with 150pF. Transmitters can be paralleled to drive multiple receivers. When FORCEOFF is driven to ground or when the AutoShutdown Plus circuitry senses that all receiver and transmitter inputs are inactive for more than 30s, the transmitters are disabled and the outputs go into a high-impedance state. When powered off or shut down, the outputs can be driven to ±12V. The transmitter inputs do not have pullup resistors. Connect unused inputs to GND or  $V_L$ .

### RS-232 Receivers

The receivers convert RS-232 signals to CMOS-logic output levels. The MAX13234E–MAX13237E have inverting outputs that are active when in shutdown (FORCEOFF = GND) (Table 1).

### AutoShutdown Plus Mode

Drive FORCEOFF high and FORCEON low to invoke AutoShutdown Plus mode. When these devices do not sense a valid signal transition on any receiver and transmitter input for 30s, the onboard charge pumps are shut down, reducing supply current to 1μA. This occurs if the RS-232 cable is disconnected or if the devices driving the transmitter and receiver inputs are inactive for more than 30s. The MAX13234E–MAX13237E turn on again when a valid transition is applied to any RS-232 receiver or transmitter input. As a result, the system saves power without requiring any control.

Figure 6 and Table 1 summarize the MAX13234E–MAX13237E operating modes. The FORCEON and FORCEOFF inputs override AutoShutdown Plus circuitry. When neither control is asserted, the IC selects between these states automatically based on the last receiver or transmitter input edge received.

### Hardware-Controlled Shutdown

Drive FORCEOFF low to place the MAX13234E–MAX13237E into shutdown mode.

Figure 7. AutoShutdown Plus Initial Turn-On to Wake Up a Mouse or Another System

Figure 6. AutoShutdown Plus and Shutdown Logic

**Table 1. Transceiver Mode Control**

$\overline{\text{FORCEOFF}}$	FORCEON	R_IN or T_IN EDGE WITHIN 30s	T_OUT	R_OUT	TRANSCEIVER STATUS
0	X	X	High-Impedance	Active	Shutdown (Forced Off)
1	1	X	Active	Active	Normal Operation (Forced On)
1	0	Yes	Active	Active	Normal Operation in AutoShutdown Plus
1	0	No	High-Impedance	Active	Shutdown in AutoShutdown Plus

X = Don't Care.

# MAX13234E–MAX13237E

# 3Mbps RS-232 Transceivers with Low-Voltage Interface, $\pm 15\text{kV}$ HBM ESD

## $\pm 15\text{kV}$ ESD Protection

ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the MAX13234E–MAX13237E have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of  $\pm 15\text{kV}$  without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After

an ESD event, Maxim's E versions keep working without latchup. ESD protection can be tested in various ways; the transmitter outputs and receiver inputs of this product family are characterized for protection to the following limits:

- 1)  $\pm 15\text{V}$  Using the Human Body Model
- 2)  $\pm 15\text{kV}$  Using IEC 61000-4-2 Air-Gap Method
- 3)  $\pm 8\text{kV}$  Using IEC 61000-4-2 Contact-Discharge Method

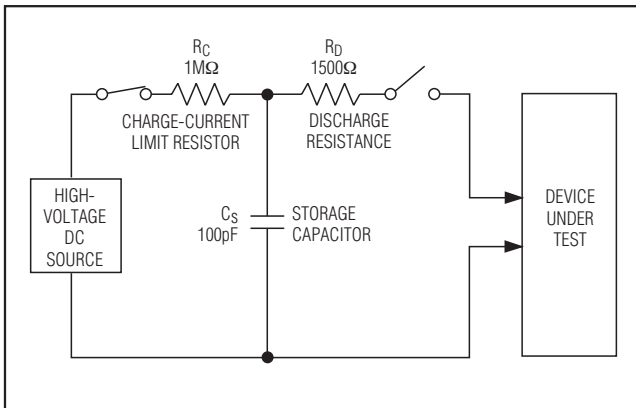

Figure 8a. Human Body ESD Test Model

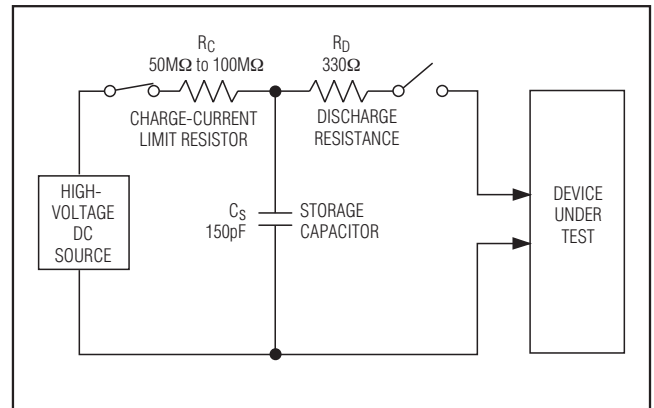

Figure 9a. IEC61000-4-2 ESD Test Model

Figure 8b. Human Body Current Waveform

Figure 9b. IEC61000-4-2 ESD Generator Current Waveform

# MAX13234E–MAX13237E

## 3Mbps RS-232 Transceivers with Low-Voltage Interface, $\pm 15\text{kV}$ HBM ESD

### ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

### Human Body Model

Figure 8a shows the Human Body Model and Figure 8b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5k $\Omega$  resistor.

### IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX13234E–MAX13237E helps design equipment that meets Level 4 (the highest level) of IEC 61000-4-2, without the need for additional ESD-protection components. The major difference between tests done using the Human Body Model and IEC 61000-4-2 is higher peak current in IEC 61000-4-2, because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the Human Body Model. Figure 9a shows the IEC 61000-4-2 model and Figure 9b shows the current waveform for the 8kV, IEC 61000-4-2, Level 4, ESD Contact-Discharge Method.

The Air-Gap Method involves approaching the device with a charged probe. The Contact-Discharge Method connects the probe to the device before the probe is energized.

## Applications Information

### Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; polarized or non-polarized capacitors can be used. The charge pump requires 0.1 $\mu\text{F}$  capacitors for  $V_{CC} = +3.3\text{V}$  operation. For other supply voltages, see Table 2 for required capacitor values. Do not use values smaller than those listed in Table 2. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. **However, do not increase C1 without also increasing the values of C2, C3, C4, CBYPASS1, and CBYPASS2 to maintain the proper ratios (C1 to the other capacitors).** When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a

larger nominal value. The capacitor's equivalent series resistance (ESR), usually rises at low temperatures influencing the amount of ripple on  $V_+$  and  $V_-$ .

**Table 2. Required Minimum Capacitance Values**

V <sub>CC</sub> (V)	C1, C <sub>BYPASS2</sub> ( $\mu\text{F}$ )	C <sub>BYPASS1</sub> ( $\mu\text{F}$ )	C2, C3, C4 ( $\mu\text{F}$ )
3.0 to 3.6	0.22	0.22	0.22
3.15 to 3.6	0.1	0.1	0.1
4.5 to 5.5	0.047	1	0.33
3.0 to 5.5	0.22	1	1

### Power-Supply Decoupling

In most circumstances, a 0.1 $\mu\text{F}$   $V_{CC}$  bypass capacitor and a 1 $\mu\text{F}$   $V_L$  bypass capacitor are adequate. In applications that are sensitive to power-supply noise, use capacitors of the same value as charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

### Transmitter Outputs when Exiting Shutdown

Figure 10 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high, the other is low). Each transmitter is loaded with 3k $\Omega$  in parallel with 1000pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of  $V_-$  exceeds approximately -3V.

Figure 10. Transmitter Outputs when Exiting Shutdown or Powering Up
